Hey Fieldguide team,

I applied for the Software Engineer role. Instead of describing my work, I built a page that maps your JD to things I've shipped:

<https://sujin.tech/fieldguide>

Two minute read, everything below is in there with demos.

The short version: 6+ years of shipping. I built Mudrex (YC W19) solo in React Native to 10M+ downloads, took DeFi frontends from \$500K to \$10M TVL, and co-founded Vanta, a health platform where I built the whole product: Next.js web apps, Express backend, and a React Native app live on the App Store.

Why I think it maps: audit software is document software. At Vanta I built the pipeline that ingests lab results and renders biomarker, DEXA and genetics reports. Before that I built a fintech backend that OCR'd receipts into clean transactions with ML classification. And your stack, TypeScript, React, Node, Postgres, is the one I work in every day.

You're hiring across levels. I'm happy to let the work decide where I land.

Sujin
